## **DIEBOLD ENHANCES SURVEILLANCE ACROSS WASHINGTON TRUST BANK'S ENTERPRISE**

*Enhancements enable powerful data analysis, advanced workflow management for commercial and financial security professionals*

NORTH CANTON, Ohio -- Adding powerful security data analytics and advanced workflow management, Diebold, Incorporated (NYSE: DBD) has expanded the capabilities of its industry-leading security management portal SecureStat®, providing in-depth analyses that enhance security operations and promote enterprise-wide efficiencies. SecureStat now features a dynamic business data analytics engine that enables companies to more effectively analyze and investigate security- and business-related activities. In addition, customers can now manage monitoring, security operations and business processes from a single source using SecureStat's new workflow management system. Diebold will debut these innovative capabilities at the 2014 ASIS International Seminar and Exhibits.

"SecureStat is a centralized Web-based security management system that provides an online security portal and customizable dashboard for regional, national and global multi-site commercial and financial customers to manage their entire security operations. Integrating business analytics into the SecureStat dashboard provides convenient examination of data related to alarms, monitoring, services, installations and asset management all from a single interface. Viewing this information dynamically in real time helps organizations arrive at actionable information that can lead to more successful security investigations and more predictive operations.

SecureStat provides the industry's leading dynamic data-sorting capabilities to quickly and easily sort and analyze vast alarm, security operations and business data into variables to investigate correlations and identify trends. With business data from multiple systems integrated into the platform, organizations can get closer to predictive models for the maintenance, service and replacement of security devices.

SecureStat's new workflow management system streamlines security and business processes related to monitoring schedule changes, access permissions, personal identification number (PIN) changes and more. Traditional workflow requests typically originate outside of a centralized system, forcing security professionals to log into different systems to submit requests and track statuses via disparate interfaces. Using the SecureStat workflow management system, any authorized party can complete requests using menus customized to the organization and then efficiently track the receipt, progress and completion of requests all from their dashboard.

"From its inception, SecureStat has delivered advanced management capabilities to help our customers enhance security across their enterprises," said Tony Byerly, executive vice president, electronic security, Diebold. "SecureStat's business analytics capabilities leverage the Internet-of-Things-connectedness of today's security technologies. The new SecureStat functionalities streamline this data aggregation and analysis to more rapidly improve our customers' businesses."
